2.6 Biogeographical Region(s)

Continental (100.0 %)

3. ECOLOGICAL INFORMATION

3.1 Habitat types present on the site and assessment for them

[Back to top](#)

Annex I Habitat types						Site assessment			
Code	PF	NP	Cover [ha]	Cave [number]	Data quality	A B C D	A B C		
						Representativity	Relative Surface	Conservation	Global
3170			0.91			D			
4030			0.91			B	C	B	B
91L0			255.36			B	C	B	B
92A0			9.12			A	C	B	B

- **PF:** for the habitat types that can have a non-priority as well as a priority form (6210, 7130, 9430) enter "X" in the column PF to indicate the priority form.
- **NP:** in case that a habitat type no longer exists in the site enter: x (optional)
- **Cover:** decimal values can be entered
- **Caves:** for habitat types 8310, 8330 (caves) enter the number of caves if estimated surface is not available.
- **Data quality:** G = 'Good' (e.g. based on surveys); M = 'Moderate' (e.g. based on partial data with some extrapolation); P = 'Poor' (e.g. rough estimation)

3.2 Species referred to in Article 4 of Directive 2009/147/EC and listed in Annex II of Directive 92/43/EEC and site evaluation for them

N16	65.0
N23	1.0
N06	2.0
Total Habitat Cover	100

Other Site Characteristics

L'area, situata ad ovest-sud-ovest di Gubbio, è caratterizzata da un'ampia conca tettononica semipianeggiante sede di un antico lago, delimitata a nord-est da una catena calcarea di poco inferiore ai 1000 m di altitudine e circondata a sud-ovest da colline marnoso-arenacee e dal Torrente Saonda. In quest'ultimo, affluente di destra del Chiascio, confluiscono i numerosi fossi che solcano l'area, interamente tributaria del bacino del Tevere. Il particolare sistema idrico di superficie, creando diverse piccole valli parallele, interrompe l'uniformità del paesaggio che ospita una particolare vegetazione acidofila o igrofila ed, in concomitanza di piccole depressioni, una preziosa vegetazione nano-terofitica propria degli stagni temporanei primaverili. Oltre agli habitat segnalati con codice ed attribuiti al Cicendietum filiformis (3132), Danthonio-Callunetum, al Salicetum albae (92A0), agli aggruppamenti a Juniperus oxycedrus (5211) ed allo Hieracio racemosi-Quercetum petraeae (9190), comprende: boschi a Carpinus betulus, dell'associazione Geranio nodosi-Carpinetum betuli; cenosi a Populus tremula e, lungo i fossi, boscaglie a Viburnum opalus ed Ulmus minor, dell'alleanza Alno-Ulmion.

4.2 Quality and importance

L'area contiene uno degli ultimi lembi di bosco planiziale acidofilo dell'Umbria e, più in generale, dell'Italia centrale. Questa cenosi forestale, assieme alle fitocenosi ad essa legate dinamicamente (brughiere a Calluna vulgaris e stagni temporanei del Cicendietum filiformis), costituisce un importante esempio del Quercion robori-petraeae, tipica del centro Europa, e qui al limite meridionale della distribuzione, e pertanto, di grande valore fitogeografico. Notevole è anche l'importanza floristica per la presenza di: Cicendia filiformis, Anagallis minima, Radiola linoides, Frangula alnus, Cardamine granulosa, Cardamine rivularis, Viburnum opulus e Baldellia ranunculoides (rare a livello nazionale); Malus florentina, Quercus robur, Quercus dalechampii (rare a livello regionale) e Calluna vulgaris di particolare interesse fitogeografico. Tra la fauna da segnalare anche Leuciscus cephalus (specie autoctona importante nei confronti della banalizzazione della comunità ittica), Buteo buteo, Cettia cetti, Falco tinnunculus (specie poco comuni).
