Other Site Characteristics

L'area è formata da un'ansa del Fiume Tevere circoscritta da boschi di alto fusto, con diverse specie di querce, tra cui Quercus robur, che rivestono il terrazzo fluviale costituito da depositi alluvionali. Nel sottobosco sono comuni Laurus nobilis ed alcune specie arbustive mediterranee.

4.2 Quality and importance

Il sito, oltre alla vegetazione ripariale del Tevere (qui in discreto stato di conservazione) e ad alcuni laghetti con cenosi idrofitiche ed elofitiche, comprende l'ultimo lembo di foresta igrofila planiziale presente in Umbria. Tale bosco di elevato valore fitogeografico e naturalistico (perchè mantenuto ad alto fusto e con ricca flora arbustiva ed erbacea), si presenta modificato nella composizione floristica più significativa: Tra le specie presenti sono segnalate Quercus robur e Laurus nobilis, rare a livello regionale. Tra la fauna da segnalare anche Leuciscus cephalus (specie autoctona importante rispetto alla banalizzazione della comunità ittica).
