Other Site Characteristics

Rilievo calcareo con importanti manifestazioni carsiche (doline) sulle ampie pendici sommitali, dove oltre agli habitat segnalati con codice ed attribuiti a: Prunetalia spinosae (5130), Thero-Brachypodion (6220), Asperulo purpureae-Brometum erecti e brizo mediae-Brometum erecti (6210), si rinvencono lembi di faggeta dell'associazione Polysticho-Fagetum e prati-pascolo a Cynosurus cristatus, dell'alleanza Cynosurion cristati.

4.2 Quality and importance

L'aspetto vegetazionale più importante del sito è costituito dalla grande estensione di pascoli dei Festuco-Brometalia, che si presentano in ottimo stato di conservazione e completi nelle caratteristiche floristiche. Per tali motivi l'area del M. Subasio costituisce il migliore esempio di pascoli calcicoli alto-collinari e submontani dell'Umbria. Tra le specie floristiche conosciute per il sito, oltre alle numerose endemiche, è stata segnalata, per la notevole diffusione, Pseudolysimachion barrelieri, specie rara a livello regionale. Tra la fauna è stato segnalato il tricottero Stactobia caspersi (specie stenotopa di ambienti igropetrici), Accipiter nisus (specie rara), Buteo buteo, Falco tinnunculus, Lepus europaeus (elemento fondamentale per la catena alimentare dell'aquila reale).
