Other Site Characteristics

Complesso prevalentemente collinare, di natura marnoso-arenacea, con morfologia molto aspra caratterizzata da versanti scoscesi, spesso semirupestri, e vallate strette e tortuose. Esso si presenta in gran parte coperto da boschi cedui e boscaglie per lo più costituiti da cerro (*Quercus cerris*) che, a seconda dell'esposizione dei versanti, si associa con il carpino nero (*Ostrya carpinifolia*) o con la roverella (*Quercus pubescens*). Solo sui versanti più elevati, con minore pendenza o pianeggianti, tali formazioni, inquadrabili nell'ordine Quercetalia pubescenti-petraeae, vengono sostituite da boschi puri di cerro o da piccoli nuclei di faggio (*Fagus sylvatica*), dell'ordine Fagetalia sylvaticae. Ai boschi si alternano estesi arbusteti a ginepri (*Juniperus communis* e *Juniperus oxycedrus*) e vaste aree calanchive con vegetazione camefitica riferibile all'associazione Coronillo minimae-Astragaletum monspessulani, dell'alleanza Xerobromion.

4.2 Quality and importance

Nonostante la presenza di diversi elementi di pressione antropica, in particolare l'utilizzazione del bosco, si rileva un elevato interesse naturalistico per la presenza di specie rare e/o localizzate.
