Other Site Characteristics

Versante, molto acclive, esposto a nord, che dalla cima di Poggio Pantano scende fino alle sponde del Torrente Sentino. L'area è quasi interamente ricoperta da boschi di carpino nero (*Ostrya carpinifolia*), dell'associazione Scutellario-Ostryetum, che sono interrotti, nei settori superiori, da piccole aree pascolative a bromo (*Bromus erectus*) e da modesti affioramenti rocciosi; il settore inferiore del bosco si contraddistingue per la folta presenza di esemplari alto-arbustivi di alloro (*Laurus nobilis*) e di bosso (*Buxus sempervirens*). Le sponde del Fiume Sentino sono poi interessate dalla vegetazione igrofila ripariale a salice bianco (*Salix alba*) ed ontano nero (*Alnus glutinosa*). Le specie *Buxus sempervirens* e *Laurus nobilis* rappresentano due entità arbustive di particolare interesse fitogeografico per il territorio regionale umbro.

4.2 Quality and importance

Importante stazione naturale di alloro (*Laurus nobilis*) e di bosso (*Buxus sempervirens*), due specie sempreverdi considerate "relitti xerotermici", che in Italia vivono spontaneamente solo in alcune regioni e per lo più in stazioni puntiformi; questa stazione, inoltre, riveste grande importanza essendo, in tutto il territorio regionale, l'unica dove le due specie convivono assieme. La stazione di alloro poi, è una delle pochissime naturali in Umbria, poichè nelle altre località boschive la specie è per lo più spontaneizzata o inselvaticita.
