Other Site Characteristics

Vasta area collinare, di natura marnoso-arenacea, che si contraddistingue per l'alternanza di boschi (che rivestono le aree più acclivi), arbusteti e campi. Le formazioni forestali sono costituite prevalentemente da cerro (*Quercus cerris*) che, a seconda dell'esposizione dei versanti, si associa al carpino nero (*Ostrya carpinifolia*) o alla roverella (*Quercus pubescens*). Solo sui versanti più elevati tali formazioni, inquadrabili nell'associazione *Acero obtusati-Quercetum cerris*, vengono sostituite da boschi puri di cerro, dell'ordine *Quercetalia pubescenti-petraeae*. Gli arbusteti, che ricoprono parzialmente le aree pascolative a *brachipodio* (*Brachypodium rupestre*) dell'associazione *Centaureo bracteatae-Brometum erecti*, sono costituiti per lo più da ginestra (*Spartium junceum*), ginepro rosso (*Juniperus oxycedrus*) o rosa selvatica (*Rosa canina*). Molto interessanti sono gli arbusteti a salici (*Salix* sp. pl.), che ricoprono, a fasce molto larghe o a grossi nuclei, i primi terrazzi del Fiume Chiascio.

4.2 Quality and importance

Nonostante la presenza di diversi elementi di pressione antropica si rileva un elevato interesse naturalistico per la presenza di specie rare e/o localizzate. Inoltre la scelta di quest'area, posta nella parte centrale dell'Umbria, tende ad individuare ambiti di raccordo per corridoi faunistici tra la parte Est e la parte Ovest della Regione.
